

EFU GOVERNANCE & PUBLIC ADMINISTRATION LICENCE v1.0

Governmental & Administrative Entropy Audit Standard

Simor István

Release date: 2026-01-12

0. Purpose and Scope

Experimental EFU-based licensing and measurement framework for public administration and government systems.

This is NOT a legal regulation, budgetary law, or administrative code. It is an **open scientific protocol** measuring the **biophysical cost of governance** in human-scale EFU units.

It covers:

- Ministries and agencies
- Local and central government
- Registries, authorities, courts
- Administrative IT and cloud systems

It answers one question:

Does the state consume more reality than it returns to society?

I. Core Concepts

1. EFU-Governance (EFU-G)

Application of EFU to public administration:

- EFU-H_GOV — office and facility energy
- EFU-W_GOV — water, sanitation, cleaning
- EFU-E_GOV — IT entropy, cooling, waste heat
- EFU-M_GOV — paper, hardware, buildings, maintenance

Total administrative load:

$$\text{EFU_G(t)} = \text{EFU-H_GOV} + \text{EFU-W_GOV} + \text{EFU-E_GOV} + \text{EFU-M_GOV}$$

2. Governability Index (G)

$$G = \text{VALUE_OUTPUT} / \text{EFU_G}(t)$$

Meaning:

- $G > 1.0 \rightarrow$ society receives more than it pays
 - $G < 1.0 \rightarrow$ bureaucratic entropy dominates
-

3. Value Output (VALUE_OUTPUT)

Measured as a weighted combination of:

- processed cases
 - digital service ratio
 - citizen satisfaction
 - decision speed
-

II. Measurement Domains

1. Energy (EFU-H_GOV)

Baseline: 12.88 MWh per person per year

$$\text{EFU-H_GOV} = \text{total_MWh_per_year} / 12.88$$

Example:

1000 staff, 15 000 MWh/year $\rightarrow$ 1164 EFU-H_GOV

2. Water (EFU-W_GOV)

Baseline: 18.25 m³ per person per year

$$\text{EFU-W_GOV} = \text{total_m3_per_year} / 18.25$$

Includes toilets, cleaning, kitchens, cooling.

3. IT & Entropy (EFU-E_GOV)

$$\text{EFU-E_GOV} = \text{waste_heat_TJ_per_year} / \text{EFU-S_baseline}$$

Note: In modern governments, ~80% of entropy comes from IT systems.

4. Materials (EFU-M_GOV)

$$\text{EFU-M_GOV} = \text{total_kg_per_year} / (20 \text{ kg per day} \times 365)$$

Includes:

- paper
 - toner
 - hardware
 - furniture
 - building maintenance
-

III. Value Output Metrics

Mandatory indicators:

$$G1 = \text{processed_cases} / (\text{EFU_G} \times 1000)$$

$$G2 = \text{digital_service_ratio} \text{ (percent)}$$

$$G3 = \text{citizen_satisfaction_NPS} / 10$$

$$G4 = \text{average_days_per_case}$$

Composite score:

$$G_total = (G1 \times 0.4) + (G2 \times 0.3) + (G3 \times 0.2) + (G4 \times 0.1)$$

IV. Efficiency Classes

Class	G_total	EFU per case	Meaning
A+	> 2.0	< 0.001	Super-efficient
A	1.5 – 2.0	0.001 – 0.005	Efficient
B	1.0 – 1.5	0.005 – 0.01	Acceptable
C	0.5 – 1.0	0.01 – 0.02	Inefficient
D	< 0.5	> 0.02	Parasitic

V. Audit Procedure

1. Data collection
 - energy and water bills

- IT logs
- administrative statistics
- 2. EFU conversion
 - using EFU 205.3 JSON Schema
- 3. Independent audit
 - EFU_G and G_total calculated
- 4. Public reporting

Mandatory report format:

Institution | Year | EFU_G | G_total | Class | EFU per case

VI. Licence Conditions

Permitted:

- self-audit
- independent audit firms
- benchmarking
- public dashboards

Mandatory attribution:

“EFU Governance Audit v1.0 – Simor István (2026)”

Prohibited:

- greenwashing
- hiding or manipulating data

VII. Pilot Example

Budapest Metropolitan Government – 2026

EFU-H = 1850

EFU-W = 320

EFU-E = 950

EFU-M = 180

EFU_G = 3300

Cases = 450 000

G1 = 0.136

G2 = 65%

$G_3 = 6.8$

$G_4 = 14$ days

$G_{\text{total}} = 1.18 \rightarrow \text{Class B}$

EFU per case = 0.0073 $\rightarrow$ Acceptable
